

06-08-2009

A method and system for re-formatting computer files. The method comprises the steps of inputting a data file into a computer, and determining if the data file is compatible with the computer. If the data file is not compatible with the computer, the data file is transmitted over the Internet to a universal server; and the universal server transforms the data file into a format compatible with the computer, and sends the transformed data file back to the computer. Preferably, the universal server identifies the type of file, and transforms the file into a different format of the same type. Also, in a preferred embodiment, a user of the computer identifies user requirements, these requirements are transmitted to the universal server, and the file is reformatted in accordance with the user requirements.
